12120 WAFER PLY TABLE TOP

Laminated lumber consists of structural grade plywood used in the building industry for flooring and truss systems. The perpendicular grain pattern varies in thickness, creating a tight pattern. The dominant wood species is European Beech with internal layers of Spruce. Other internal woods may be substituted based on availability. Tops may have voids in the plys that are covered with topcoat. Imperfections are part of the natural beauty and interest of the surface.
We offer the table tops standard in our WBF259 Natural Tint finish. Darker finishes are not recommended, as the surface quickly loses its beauty and becomes solid in color.

Features:

1-1/4" thick table top
